The gelatin, instead of being brittle, is now soft and pliable; it is also more transparent than it was. The increase in size and weight is explained by the fact that particles of water have forced their way between the particles of the gelatin, spreading them apart. Since the gelatin particles have been forced farther apart, the gelatin is more pliable and the particles cling to one another less firmly. Hence when a piece of dry wood is put into water, it imbibes water and swells. The cell walls of a root, like wood, are largely composed of cellulose and they take up water in the same way. When dry seeds are placed in water, they imbibe water and increase in size. Indeed, most organic substances have...
