Then the cases of *Ascaris*, *Helix* and *Strongylocentrotus* where the number of chromosomes is either n or $2n$ are curious, but they do not speak for a condition of fluctuating variation, and may be more readily explained as an additional division of all the elements. come to behave differently from those of the germ cells and even perhaps come to lose their individuality. Change in chromosomal number and behavior might be a regular concomitant of somatic differentiation, quite exclusive of any process of chromatin diminution. This is only a tentative hypothesis, but it may open up a new path in the investigation of the chromosomes. Whatever conclusions be reached for the tissue cells, however, need not in any way invalidate the theory of the continuity of the chromosomes...
